COMMIT FOR GOOD 2026 · AI FOR RESILIENT AND SUSTAINABLE SUPPLY CHAINS

Most failed medicines come from factories we already knew about.

DawaDrishti: a national memory of India's failed medicine batches, and a lookup every buyer can call before buying.

Abhishek Jadli · dawadrishti.onrender.com · github.com/AbhishekJadli007/dawadrishti

THE PROBLEM

Public buyers can't see a supplier's national record before they buy

3,104
drug samples declared not of standard quality in 2024–25

24
children dead after Coldrif syrup, as of 15 Oct 2025

40
failures from one Rajasthan supplier: banned a year, then reinstated

0
buyer ERPs that read CDSCO's national failure list

CDSCO publishes every failed batch. Buyers' ERPs never read it. A supplier that fails in one state keeps winning orders in another.

WHERE IT BREAKS

The goods flow works. The information flow doesn't.

Late, incompatible information

Monthly PDFs and a portal page; one factory spelled up to 14 ways

Local decisions ignore the network

A buyer can't see a failure found in another state

Single points of failure

Pausing a bad supplier must be weighed against supply

WHAT WE FOUND · REAL CDSCO DATA, 2017–2026

Two in three failures were predictable from the public record

- **64.9%** of 6,442 failed batches came from a factory with an earlier alert (95% CI 62.2%–67.4%)
- Next failure about **8 months** after the first: time to act
- **53%** of repeats found by a lab that had never caught that factory
- **48%** of all failures from just 10% of factories

WHY IT'S HARD

The same factory is spelled up to 14 different ways

Share of failed batches that look like repeats

One factory, as written in the alerts (14 ways):

- Martin & Brown Bio-Sciences Pvt. Ltd
- Martin & brown bio-sciences pvt. Ltd
- Martin& Brown Biosciences Pvt. Ltd
- Martin & Brown Bio Sciences
- Martin & Brown Bio-Sciences
- Martin & Brown Bio-sciences
- Martin & Brown Biosciences Pvt. Ltd
- Martin &Brown Bio-Sciences Pvt. Ltd
- Martin & Brown Bio Science Pvt Ltd
- Martin and Brown Biosciences

- **5,521** raw name strings resolved into **1,994** factories
- Tested on held-out hard pairs: **precision 1.00**, so no false merges
- Uncertain pairs go to a **human review queue**, never guessed
- A PDF reader audited against CDSCO's portal: **96.9%** of rows match

THE HONEST PART

The disasters, checked against the record

Sresan Pharmaceutical

Coldrif deaths reported from early Oct 2025

0

national alerts before the incident (11 in total)

Maiden Pharmaceuticals

WHO alert 5 Oct 2022

0

national alerts before the incident (6 in total)

Kaysons Pharma

40 samples failed in state testing 2021-23 (Down To Earth)

0

national alerts before the incident (0 in total)

National alerts alone would not have caught these. So the memory must also take **state-lab and buyer results**, and that is our next step. We show this rather than hide it.

OUR SOLUTION

A national quality memory, and one lookup any ERP can call

Public

Anyone

Every published failure per factory, dated, with data limits and a correction link. No predictions.

Buyer

At order and delivery

A graded response and supply concentration. A batch already on the national list is held on arrival.

Regulator

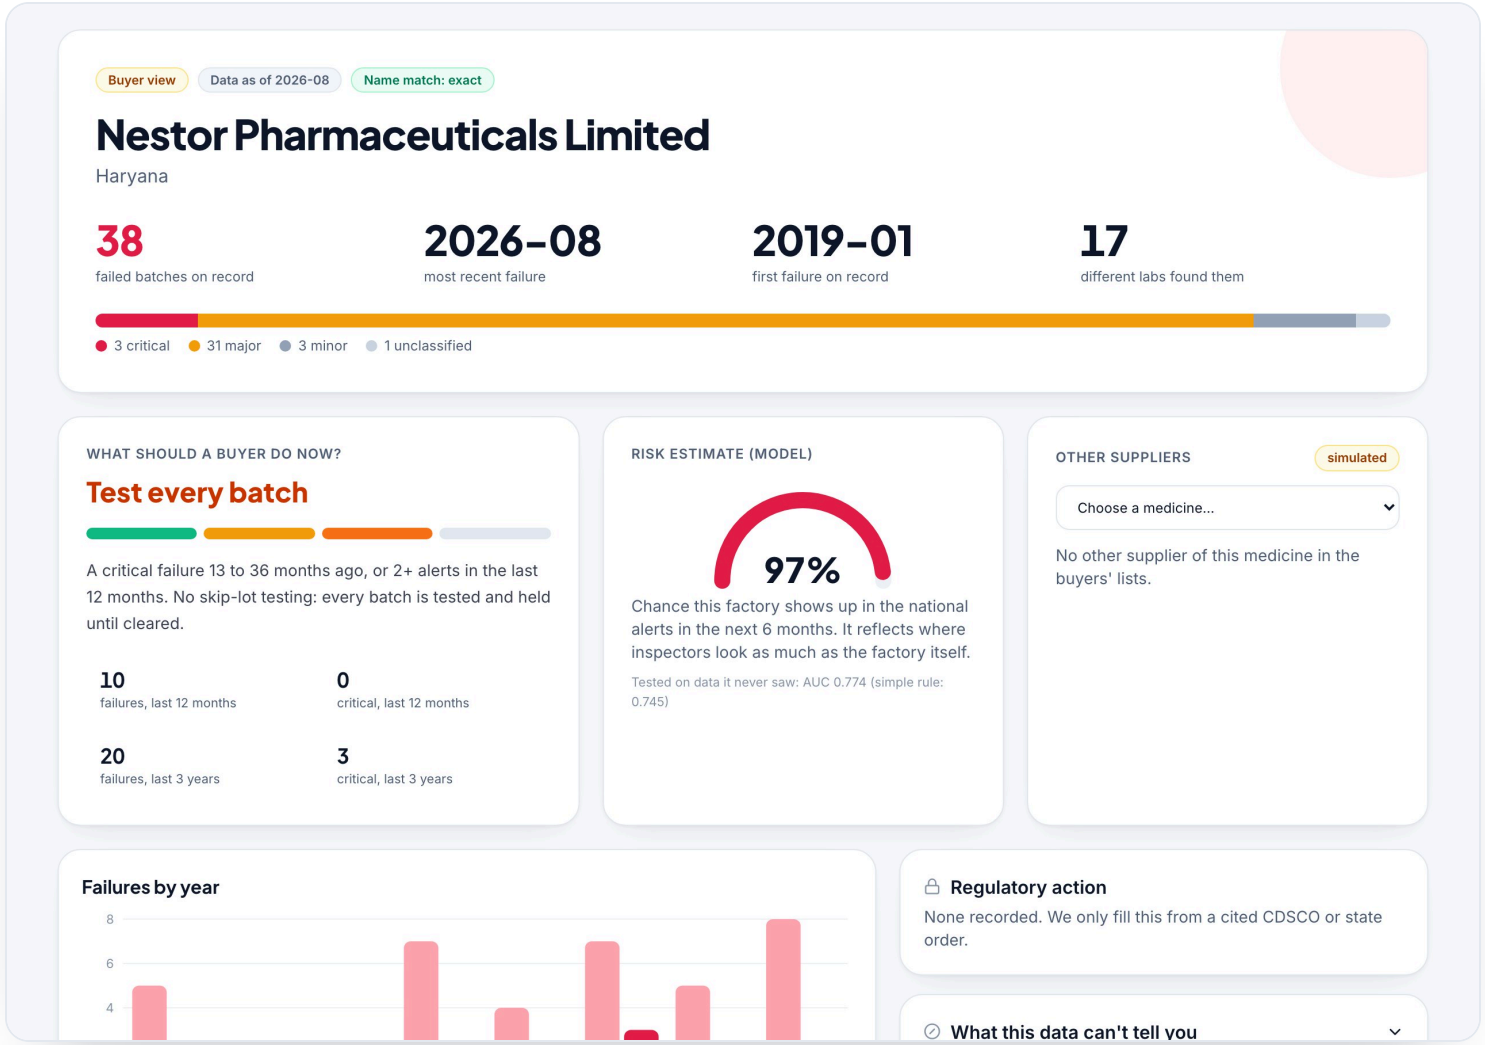

Where to sample

Units ranked by future regulatory attention, with the alerts behind each rank. Conformance checks on event logs.

Level	Response	When
3	**Pause new orders**	critical failure in 12 months, or debarred
2	**Test every batch**	critical in 36 months, or 2+ alerts in 12
1	**Prefer alternatives**	any alert in 36 months

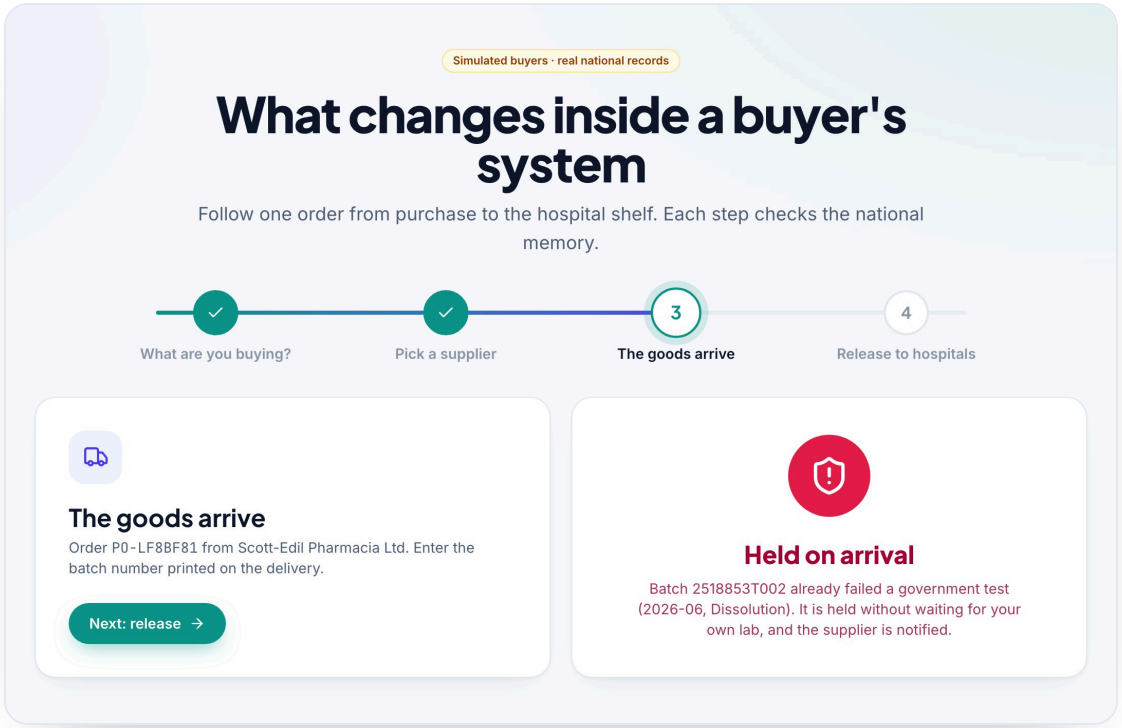

DEMO · CHECK A MANUFACTURER

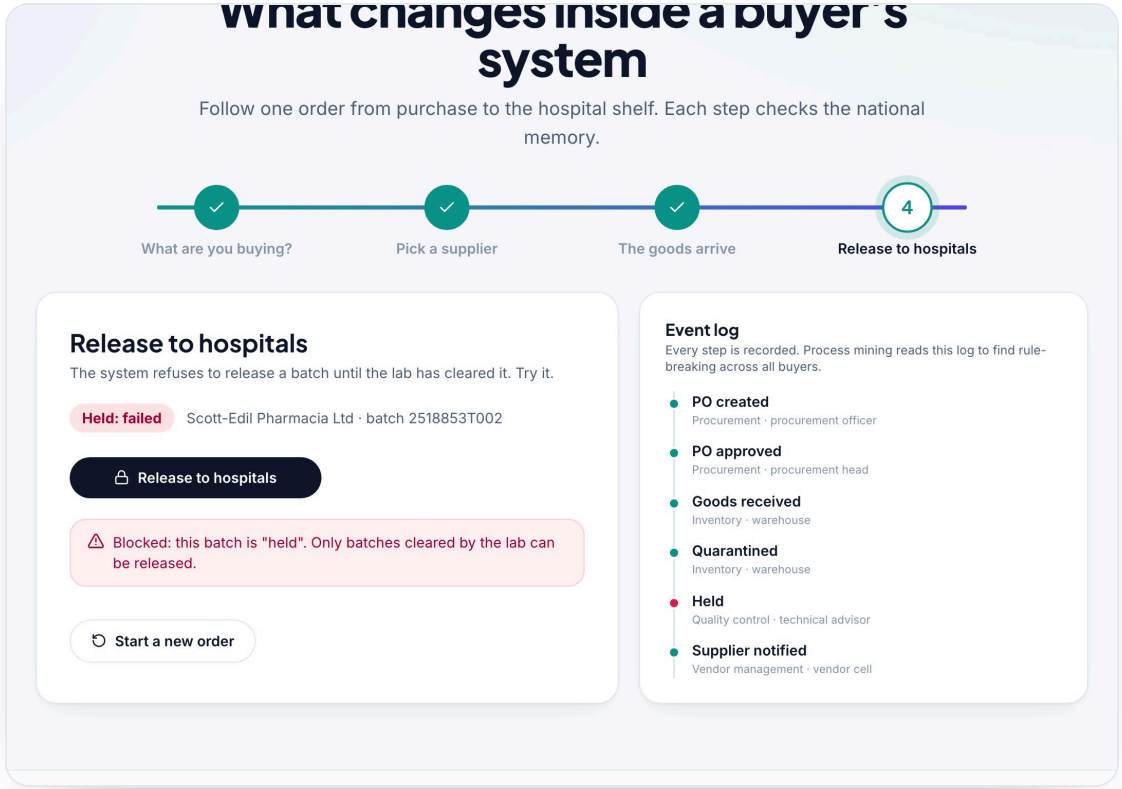

The record, in plain language, with a clear answer

DEMO · INSIDE A BUYER'S SYSTEM (SIMULATED BUYERS, REAL RECORDS)

Held on arrival. Blocked until cleared.

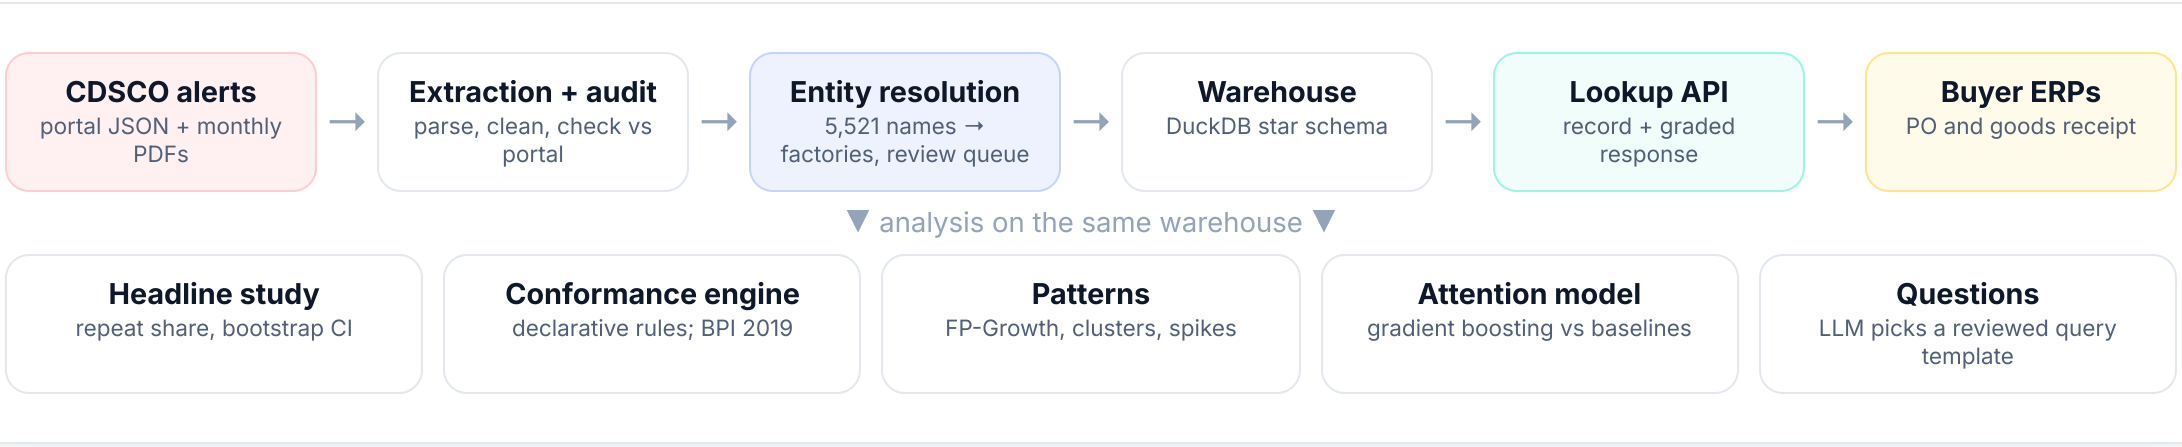

Order from a supplier marked "test every batch" → the delivered batch is already on CDSCO's list, so it is **held on arrival** → release is **refused** until the lab clears it. Every step is logged.

HOW IT WORKS

From scattered PDFs to an answer at the moment of purchase

Explain
entity resolution and the record per factory

Detect
exact-batch check; conformance rules

Recommend
graded response with the supply cost

Predict
where to sample; which batch first

Ask
the LLM picks a reviewed query; never writes SQL

EVIDENCE

Every claim, against a baseline

Failed batches from factories already on record	Real	**64.9%**
PDF reader vs CDSCO portal	Real	**96.9%**
Name matching, held-out hard pairs	Real	**P 1.00 / R 0.62**
Who appears in the next 6 months of alerts	Real	**AUC 0.774**
Same, when a new lab finds the failure	Real	**AUC 0.765**
Conformance engine on a real SAP log	Real	**655**
Test the riskiest batch first	Simulated	**69.1%**
Shared memory vs isolated ERPs	Simulated	**−81%**

Where the simple rule wins, we say so: on the top 50 alone, "most recent failure" beats our model (84% vs 76%).

On a real SAP log (1.6M events) our engine reproduced all 4 published counts and found 655 payments before goods receipt, but none where SAP enforces the rule.

RESPONSIBLE · OPEN · NEXT

A public-record aggregator, not a blacklist

- Public pages show records, never predictions (enforced by the API)
- Every figure dated; data limits and a correction route on every record
- No guessed identities; fakes not counted against the firm they abuse
- MIT · 22 tests · one-command rebuild · Docker · live demo

ROADMAP

3 months: human label review; state labs and buyers send results in
6 months: pilot inside one state corporation's ERP
12 months: DVDMS / e-Aushadhi connector; licence master
